

Brain Setup Progress — 2026-08-19

STATUS

The initial Silent Foundry Brain skeleton has been established in Obsidian.

The overall organisational structure is now sufficiently developed to stop adding major folders and begin building the operating logic and populating real knowledge.

COMPLETED TODAY

Reviewed and cleaned the main Brain structure, including:

- Ventures
- Brand DNA
- Deal Flow
- China
- Academy
- Research
- Team
- Website
- Agents
- Company
- Funding
- Relationships
- Exits
- Creative
- Product
- Finance
- Legal
- Outreach
- Inbox

Backlinks and several structural inconsistencies were checked during the review.

00_SYSTEM

The system layer now contains:

- Agent Handoffs
- Agent Monitoring
- Agent Operations
- Agent Permissions & Approvals
- Capture & Intake
- Contribution Rules

- Current State
- Decisions
- How the Brain Works
- Information Flow
- Knowledge States
- Open Questions
- People & Roles
- Project Brain Setup
- Silent Foundry
- Source & Evidence Rules
- Templates
- Triggers & Actions

The `00\_SYSTEM` skeleton is considered complete for now.

Do not add additional system notes unless actual use demonstrates a missing function.

IMPORTANT PRINCIPLES ESTABLISHED

The Brain is intended to be a fluid organisational knowledge and operating system, not simply a filing system.

Information should eventually flow approximately as:

CAPTURE → EXTRACT → CLASSIFY → CONNECT → TRIGGER → REVIEW → ACTION / DECISION → UPDATE BRAIN

Human contributors should not need to manually maintain multiple interconnected records.

A useful comment, conversation, email, call, meeting or document should be captured once. Agents should eventually extract relevant information, connect it to existing knowledge and identify resulting actions.

Example:

Michel mentions that a company could be a strong partner for SWITCH.

The system should be capable of connecting:

Michel → company → SWITCH → capability → potential partnership → research → relationship → possible outreach → action

The original source should remain traceable.

CONVERSATIONS & MEETINGS

The future system should ingest useful information from:

- calls
- meetings
- transcripts
- emails
- messages
- voice notes
- informal team observations
- investor conversations
- partner conversations

A Conversation Agent has been added under the agent architecture for this purpose.

The objective is not merely transcription. Important information should be extracted and routed into the Brain.

AGENT OPERATIONS

A future always-on operating layer is planned.

Likely functions include:

- email and inbox management
- calendar and scheduling
- meeting preparation
- meeting transcription and follow-up
- CRM
- investor relations
- sales and outreach
- follow-ups
- newsletters
- project operations
- recurring research
- management briefings
- finance monitoring
- legal/IP monitoring

A dedicated Mac mini may eventually operate the orchestration/runtime layer.

Agents should operate under explicit permissions and approval rules.

NEXT STEP

Do not expand the skeleton.

Next Brain session begins with:

`00\_SYSTEM/Templates`

Define standard structures for:

- Person
- Company
- Interaction
- Idea
- Opportunity
- Action
- Research
- Investor
- Decision
- Project Brain

After templates:

1. Populate the new system-rule notes.
2. Review older system notes for outdated assumptions.
3. Populate core Silent Foundry knowledge.
4. Populate the SWITCH Project Brain.
5. Establish cross-linking conventions.
6. Configure agent responsibilities and workflows.
7. Develop capture/transcription workflows.
8. Develop operational automation.
9. Implement the always-on runtime later.

CURRENT POSITION

Skeleton complete.

Next phase:

RULES → TEMPLATES → KNOWLEDGE → CONNECTIONS → AGENTS →
AUTOMATION
